HEALTH CARE FACILITIES

safeEARTH a division of The healthAIR Group
Better Service - Not a Goal, a Requirement

The healthAIR Group provides comprehensive regulated waste management programs to the health care industry. Our staff of professional waste management consultants has assisted a wide variety of hospitals, clinics, laboratories, and other health care facilities in the development and implementation of environmental policies and procedures designed to comply with federal, state, and local hazardous waste regulations. These services include:

Pharmaceutical Waste

Medical Facilities can often generate large volumes of out-dated or unused portions of medications requiring disposal. Many of these items would be considered "hazardous wastes" under federal and state regulations. healthAIR, inc. will assist your facility in managing these materials as "Universal Waste" allowing your facility to take advantage of less stringent regulatory requirements. These wastes typically include toxic, flammable, and other liquid medications generated throughout your facility.

Laboratory Waste

Medical facilities typically generate significant volumes of on-site laboratory wastes. These items often include off-specification reagents, tissue fixatives such as xylene or formalin, and other chemical wastes. Although some of these chemicals can be disposed on-site, most require off-site treatment prior to disposal. The healthAIR Group is experienced in developing laboratory waste management programs to assist in the collection, storage, shipment, and disposal of these waste streams.

Facility Waste

All facilities have maintenance and custodial services for general building cleaning and infrastructure needs. Maintenance disposal needs include items such as oils, coolants, solvents and paints. Custodial services utilize materials such as floor finishes and cleaning solutions. Many facilities require the proper management and recycling of universal waste items such as lamps, ballasts and mercury-containing devices.
